

Honorables Quality System Summary

Core Philosophy

Quality is a property of resources and items, not characters. The world generates potential; players discover, preserve, transform, or squander it.

Event-Driven

Quality is interpreted only during transformation events such as mining, harvesting, smelting, crafting, imbuing, cooking, glyph modifications, and similar operations. Runtime gameplay uses realized attributes.

Propagation

Every transformation finalizes the quality of its output. Later transformations start from that realized value and never retroactively overwrite previous work.

Gameplay

Quality influences base item performance and workability. Higher-quality items are better substrates for future enhancements and transformations.

Compounding

Quality compounds through production, encouraging exploration, settlements, infrastructure, and skilled craftsmanship.

Distribution

World-seed-generated Voronoi capitals define deterministic regional potential through category dictionaries (geological, botanical, agricultural, faunal, cultural) with nested subcategory quality ranges.

Sampling

Resources sample deterministically from their relevant subcategory range based on location and world seed. The sampled value is stored on the item.

Surveying

Adventurers discover regional potential while specialized tools reveal deeper resource-specific information.
